Creating Marketing Solutions From Chaos

WordPress Site Maintenance

Hackers control sometimes as many as 50,000 web sites through injected malicious code.

What can web site owners do to protect themselves from intruders or "brute force" attacks? ***Web site maintenance*** is the answer to that question.

Hacking is becoming a critical issue for small business web sites. Your Computer Lady wants to protect your web site. It is so critical that I am offering this service **AT MY COST** to make it as affordable as I can so that each of you will take advantage of it.

Your Computer Lady has most of its clients on a WP Maintenance plan. What began a few years ago as semi-annual software updates and monthly full backups of clients' web sites is no longer sufficient.

WordPress Maintenance

$30 per month

YCL will bill your credit card monthly

The malware and hacking issues now demand a full cycle maintenance service. The basic maintenance plan covers all the areas that keep your site safe. That includes:

- YCL will install **monitoring software** that reports your site performance, visits, successful or non-successful intrusions, viruses, malicious code injections and vulnerabilities as well as changed files on a daily, sometimes hourly, basis. When an alert is issued YCL will visit the site immediately to check for compromised functions.

- Two times a year, YCL will update your site's theme. This is the programming that is the structure of your site.

- Six times a year, YCL will update your WordPress software and all plug-ins.

- **Every time** YCL edits your site, whether they install new software or update existing ones, YCL **will manually do a full site update** that is stored on-site and on their development server. (A development server is a separate, un-connected server for testing.) This way we always have two fully functioning and restorable backups. In addition, when core updates are issued, YCL will test major updates on the development server to confirm that they are in compliance with all other components on your site and that no unwanted changes occur. Only if the updates check out will YCL perform core updates on your live site.

- In addition, YCL will also perform monthly **scheduled full site backups**, including the WordPress database(s) and core files that are stored off-site for a minimum of 3 months. YCL already provides daily backups which are kept for 30 days. This is no longer sufficient.
